CCTV Power-Thru Converter Balun (500024-CNV) Quick Installation Guide

Introduction

The CCTV Power-Thru Converter Balun (500024-CNV) allows video and remote power to be transmitted via one 4-pair Cat 5e/6 cable, thus eliminating the need to install multiple cables for more efficient cabling in the analog CCTV security and surveillance environment. Furthermore the product converts 24VAC to 12VDC @ 400mA to allow 12VDC cameras to be remotely powered from a central 24VAC CCTV power supply. The CCTV Power-Thru Converter Balun works in conjunction with MuxLab's CCTV Power-Thru Balun (500024), Passive CCTV Power Integrator Hub (500136), Passive CCTV Hub (500130) and LongReach II Active Balun (500124) and Hub (500126, 500127) for a complete cabling solution.

Installation

Pre-Installation Checklist:

Note: For regulatory reasons, use of a Class II power supply is recommended and may be required with the use of this product in some regions.

- 1. The CCTV Power-Thru Converter Balun (500024-CNV) is designed to be installed at the camera side.
- 2. Ensure the CCTV equipment and remote power supply is turned off.
- 3. One (1) twisted pair is required for the camera video signal. Three (3) twisted pairs are required for remote power.
- 4. Verify that the cable length is within MuxLab specifications. The maximum distance for 24VAC and remote power is 795 ft. (242m) at the maximum allowable power consumption of 400mA.
- 5. Identify the pin configuration of the balun by checking the product label or the specification section of this installation guide.

Installation:

Class II Power Supply (24VAC)

- At the camera side, connect the coaxial cable lead of the 500024-CNV into the BNC-F connector of the CCTV camera.
- 2. At the camera side, connect the balun's red and black wires to the 12VDC power input terminals of the camera.
- Connect a 4-pair Cat5e/6 cable to the balun. The cable must be terminated straight-through with an RJ45 modular plug according to either the EIA 568A or 568B wiring standard. Cross-connection hardware such as wall outlets and patch panels may be used as required.
- 4. Note: The CCTV Power-Thru Converter Balun is reverse polarity sensitive. When connecting the baluns, ensure that "Ring [R]" is connected to "Ring [R]" and "Tip [T]" is connected to "Tip [T]". Verify that there are no split pairs or crossed wires.
- 5. At the head end (DVR or IP encoder), repeat steps 1 to 3 for the receiver side balun or hub (i.e. 500024, 500130, 500124, 500126, 500127, 500136).
- Power-on the CCTV equipment and central CCTV power supply. Verify image quality.
- 7. The following diagrams show typical configurations using the 500024-CNV.

RJ45 RJ45 4-pair Cat5e/6 cable DVR 12VDC 500024-CNV **CCTV Camera** 12VDC @ 400mA max **CCTV Power-Thru Converter Balun** (500024-CNV) Passive CCTV Hub 500130 **CCTV Camera** 12VDC DVR 24VAC **Security Console** 500024-CNV **CCTV Camera** IDF

Troubleshooting

The following table describes some of the symptoms, probable causes and possible solutions regarding the CCTV Power-Thru Converter Balun. If you still cannot diagnose the problem, please call MuxLab Technical Support at 514-905-0588.

Symptom	Probable Causes	Possible Solutions
Poor picture quality, distortion, interference	1. EMI interference.	Check that wiring is not too close to transformers and ballasts.
	2. Wires reversed on signal pair on one side	Make sure that the wires on the signal pair are not reversed on one side.
	3. Split pair	Check if the UTP pairs are split and correct. Each signal pair must be twisted.
No video image	1. Power-off.	Check power supplies of CCTV equipment. Check power supply fuse.
	2. Wrong pin configuration	Check pin configuration and verify straight-through wiring.
	3. Defective CCTV Balun	Change CCTV baluns for another pair.
Picture faded or weak	Exceeded distance specifications	Check DC loop resistance and verify if distance spec is exceeded. Reduce cable length or eliminate high-loss components.
	2. Lower grade UTP cable is introducing high signal losses.	Use signal repeater for extended distance or replace cable by higher grade.
No power or intermittent power at camera	1. Wrong pin config.	Check wiring
	2. Distance exceeded	Verify distance specifications for remote power. Move power closer to camera.
