STICK-ON® SERIES

Model ST-GCA3

Audio Gain Control Amplifier

- Automatic Gain Control
- Wide Dynamic Range AGC
- Slow Inaudible Gain-Reduction
- Tight Dynamic Control
- Positive, Fast Gain Reduction
- Low-Noise and Low-Distortion AGC
- RDL SupplyFlex™ Power Input Configuration

The ST-GCA3 Gain Control Amplifier is part of the group of STICK-ON products from Radio Design Labs. The durable adhesives provided with the ST-GCA3 permit permanent or removable mounting. Numerous available mounting accessories, brackets and rack-mount chassis are optionally available to facilitate any system design. The ST-GCA3 is a unique, high-performance electronic module offering constant, automatic level control of audio signals. STICK-ONS are designed, built and rated for continuous duty in professional A/V systems.

APPLICATION: The ST-GCA3 is a high performance automatic gain control amplifier designed to maintain a constant average output level over a wide range of input levels. It automatically adjusts for changes in input levels, bringing up low levels and reducing high levels. The adjustment rate is switch-selectable to either **SLOW** or **FAST**. The **SLOW** setting on the ST-GCA3 is the ideal choice anywhere slowly varying audio levels such as music need to be maintained at a constant level. The slow gain-riding maintains the desired average operating levels without introducing any audible compression artifacts. The **FAST** setting of the ST-GCA3 makes it ideal for use in systems prone to loud bursts of audio, and inconsistent levels which must be constantly and quickly corrected, such as voice. The gain of the ST-GCA3 automatically adjusts to deliver a nominal +4 dBu line level output. The **MIC** level output is 50 dB below the line output. The regular AGC action is supplemented by a circuit which detects the amount of peak material present and speeds up the AGC correspondingly. When audio is not present on the input, AGC searching is limited to about 5 seconds. During a sustained period without audio input, the ST-GCA3 outputs fade to a muted condition. When audio is next applied, the output instantly ramps up to the correct level.

Two LED indicators are provided to make setup accurate and simple. A green LED varies in intensity to show the amount of expansion. An adjacent yellow LED varies in intensity indicating gain reduction. For most installations, a normal audio level is applied and the gain trimmer is adjusted for minimum indication on both LEDs, producing equal available expansion and gain reduction.

The ST-GCA3 features RDL SupplyFlex. The power supply input may be fed from a floating (not ground-referenced) 24 Vdc power source, from a bipolar power supply (\pm 12 Vdc or \pm 15 Vdc), or from a ground-referenced 24 Vdc power supply. A jumper on the terminal block is used to select the ground-referenced power configuration.

Some examples where levels are not consistent, but often need to be:

- Production studio outputs feeding recording machines
- Mic mixer output where people speak at inconsistent levels
- Audio feeds from telephone systems
- Line-level feeds in an audio system where users can set controls too high or too low
- Pre-conditioning levels into an audio limiter
- Paging, intercom, and interconnect systems

Making audio levels uniform and consistent improves the performance of nearly any type of audio system in broadcast, paging, or sound reinforcement. With its unique combination of features, exceptional audio performance, and convenient installation, the ST-GCA3 provides the solution! Use the ST-GCA3 individually, or combined with other RDL products as part of a complete audio/video system.

STICK-ON® SERIES

Model ST-GCA3

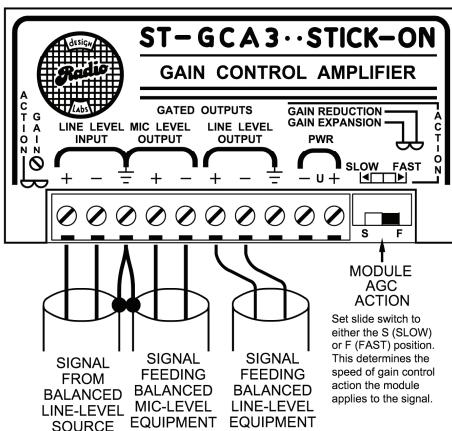

Audio Gain Control Amplifier

Installation/Operation

EN55103-1 E1-E5; EN55103-2 E1-E4

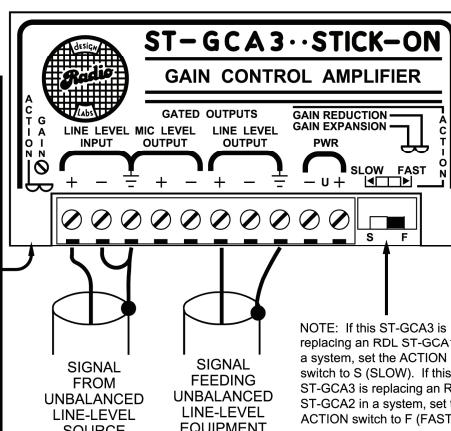

Typical Performance reflects product at publication time exclusive of EMC data, if any, supplied with product. Specifications are subject to change without notice.

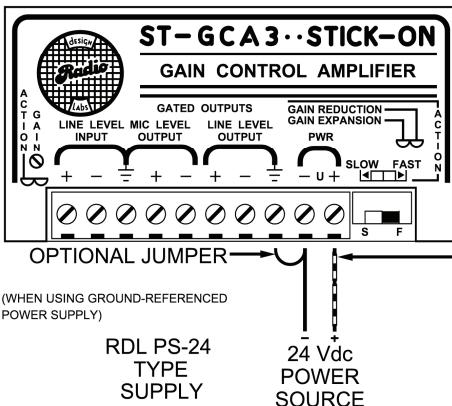

AUDIO WIRING

25 TURN GAIN SET ADJUSTMENT

For most installations, adjust gain with a "normal" input level applied. The LEDs show the amount of expansion (green LED) or gain reduction (yellow LED). Turn up the gain until the green LED becomes dimmer and the yellow LED is not flashing frequently. This setting provides equal available gain reduction and expansion. If less gain reduction and more expansion is desired, then adjust for greater activity of the yellow LED. If less expansion is desired, adjust for a brighter green LED and no yellow flashing. The intensity of each LED indicates approximately 18 dB of activity (expansion or gain reduction).

NOTE: If this ST-GCA3 is replacing an RDL ST-GCA1 in a system, set the ACTION switch to S (SLOW). If this ST-GCA3 is replacing an RDL ST-GCA2 in a system, set the ACTION switch to F (FAST).

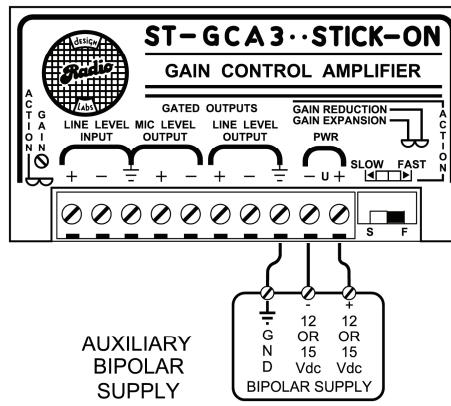

SUPPLY WIRING

DO NOT GROUND NEGATIVE FOR FLOATING OR BIPOLAR POWER INSTALLATION

OR

ADD GROUND JUMPER TO SUPPLY "-" FOR GROUND-REFERENCED POWER INSTALLATION

AUXILIARY BIPOLAR SUPPLY
12 Vdc OR 15 Vdc
GROUND N 12 Vdc
BIPOLAR SUPPLY D 15 Vdc
